# 1 Introduction

RECONZ is a web based system keeps records of all suspects who may turn into offenders and later accused as the case may be. It keeps track of the evidences and court cases as well. If the suspect turns out to be accused, then verdicts and sentences are also recorded.

The system also offers a miniature version to record details in remote areas where Internet connectivity is intermittent. It is a desktop version application, which can be connected to Internet at a later time to synchronize the data in the server.

The system is ably supported with fingerprint management module, which can be used to capture fingerprints of the suspects and later identify suspects based on the fingerprints. This eliminates the non-identification of suspects and makes them repeated offenders, even if the suspect changes name and try to hide.

## 2 Feature List

S. No.	Feature	Description
1.	Master Entries	<p>Following master entries are made by the Administrator:</p> <ul style="list-style-type: none"> <li>• Parishes</li> <li>• Courts</li> <li>• Species</li> <li>• Crime Type</li> <li>• Verdict Type</li> </ul>
2.	Suspects Profile Management	This module enables officers to enter profile of the suspect along with the offence.
3.	Arrests Management	This module enables officers to enter arrest details along with crime type for which person has been arrested.
4.	Evidence Management	This module enables officers to enter item / evidence details seized from the suspect. Also, if the item / evidence are sent to another location by officer, the details are also captured.
5.	Offenders Management	When the suspect is treated as offender, an entry is made by officer along with the action taken.
6.	Court Cases Management	This module enables officers to enter court case details along with Start Date and Finalized Date of the court case.
7.	Accused Management	The offender is made accused through this module. There is option to add multiple accused in the same court case.
8.	Verdicts Management	This module enables officers to enter verdict details for the accused. This records court name, date of verdict and whether case has been moved to another court.
9.	Sentences Management	This module enables officers to enter options given for sentences, along with prison name, start date and end

S. No.	Feature	Description
		date, if applicable.
10.	Reports	The system generates various summary reports on different criteria like pending cases, arrests, verdicts, etc. In addition, system also generates custom report extracts based on the columns and conditions chosen by the users.
11.	User Administration	This module enables administrator to manage users and define their units and roles.
12.	Fingerprint Management	It is a desktop based module to capture fingerprints of the suspects and upload fingerprints on the server. It allows capturing all ten fingerprints. The module can be used to identify suspects at a later time.
13.	Offline System	Offline system is available, which can be installed in the laptop and works in offline mode. At the end of the day or whenever the officer is in Internet available area, the data can be ported to the server.
14.	Multi-lingual Capabilities	The system is available in French and Spanish in addition to the English language.
